WELCOME TO ENUM.ORG

This site is intended as a resource for those participating in the 2006 North American ENUM Trials, and for those interested in learning more about ENUM as an essential link between the many disparate "islands" of VoIP service providers.

ENUM unifies traditional telephony and next-generation IP networks, and provides a critical framework for mapping and processing diverse network addresses. It transforms the telephone number—the most basic and commonly-used communications address—into a universal identifier that can be used across many different devices and applications (voice, fax, mobile, email, text messaging, location-based services and the Internet).
